

ABSTRACT OF DISCLOSURE

5 A system and method for book-marking a particular location in virtual space are provided to book-mark static information only in the virtual space. Pieces of information such as a user ID, a location and a world ID are transmitted to a web server while book-marking. The web server transmits user's background screen by taking a single snapshot based on the received information.

10 Furthermore, when returning to the user's original location, a web server browsing system interprets the information on the screen by taking the snapshot and transmits the same to a web server system. Therefore, the web server transmits a screen of the location based on the

15 information so as to display the screen on the user's monitor of the web browsing system. Herein, the data includes not only the background screen but also all information on the current status at the location.
